

Dinosaur Maths Challenge

Jump right in to the world of the dinosaur with this fun mathematical challenge!

Teaching resources by Education Destination Ltd.

Curriculum relevant materials supporting school trips to the Isle of Wight

Book today with Education Destination and get full access to this and hundreds more quality resources

www.edudest.uk

These 3 activities can be completed in groups in a carousel system.

Footprints!

Investigate the area of the footprints and the mass of two types of dinosaur using the foot casts in the museum.

On The Move

Investigate the step of a *Brachiosaur*.

You will need to find out the known distance of an adult *Brachiosaur* step and the length of its leg to the hip.

Your investigation will include:

- Estimates
- Use of data
- Comparisons
- Calculations

You will also travel back in time by constructing a timeline!

Dinosaur Data

Use scale and ratio to find out the facts about dinosaurs!

Make a scale drawing of an adult *Brachiosaur*.

Compare, measure and calculate!

Estimate the height of the *Brachiosaur* and work out the actual height compared to an average man.

ON THE MOVE

Walking with Dinosaurs

Investigate the step of a *Brachiosaur*.
Use the grid below to record all your answers.

- ▶ Estimate the length of an adult *Brachiosaur* step.
- ▶ Find out the length of an average adult *Brachiosaur* step. Record the length. Measure it out on the floor.
- ▶ Compare with your own step. Record the difference.
- ▶ How many times bigger is the *Brachiosaur* step than your own?

My step	
Difference between my step and <i>Brachiosaur</i> step	
How many times bigger...	

Extension Task

Use your research skills to find out about the steps of other dinosaurs. Compare their foot size with the size of their step.
Create a table.

Dinosaur	Length of step	Foot size

ON THE MOVE

INFORMATION

- ▶ The first dinosaurs appeared about 230 million years ago
- ▶ *Brachiosaurus* lived about 150 million years ago (Jurassic Period)
- ▶ The last dinosaurs disappeared 65 million years ago
- ▶ Man's ancestors appeared about 6 million years ago
- ▶ Modern man has been around for the last 200,000 years (0.2 million yrs).

$$\begin{aligned}
 1 \text{ million} &= 1000,000 \\
 &= 1000 \times 1000 \\
 &= 100 \times 10,000 \\
 &= 10 \times 100,000
 \end{aligned}$$

$$\begin{aligned}
 1 \text{ metre} &= 100 \text{ cm} \\
 &= 1000 \text{ mm}
 \end{aligned}$$

Time Travel

How could you draw a timeline showing 230 million years? That's a long time!

Teaching resources by Education Destination Ltd.

Curriculum relevant materials supporting school trips to the Isle of Wight sent 1 million years, how

Book today with Education Destination and get full access to this and hundreds more quality resources

www.edudest.uk

- ▶ What if 1 metre represented 10 million years?
 - ▶ Or 1 metre represented 100 million years?
1. Find a suitable scale for your own time line. This could be measured out on the floor or on paper, depending on space and scale.
 2. Mark out your timeline showing every million years.
 3. Label it with the events in the information box.

What do you notice about the time modern man has been around?

DINOSAUR DATA!

Find the large drawing on the back wall.

Look and Estimate

Estimate the height of the *Brachiosaur* _____ m _____ cm

Why do you think this is?

Teaching resources by Education Destination Ltd.

Measure and Calculate

If the skeleton of the man represents the height of 1.80m, use the measuring bar at the side of the wall chart to work out the actual height of a *Brachiosaur*.

_____ m _____ cm

Compare

Notice how far up the *Brachiosaur* leg the man's head is on the drawing.

How many cm does this represent? _____ cm

Find this place on the mounted *Brachiosaur* leg.

Measure how high this is from the base: _____ cm

What do you notice?

How could you explain this difference?

DRAWING TO SCALE

Using the information available to you, make a scale drawing of an adult *Brachiosaur* on cm squared paper. Don't forget to label your drawing with the scale used:

1cm=1m (1:100)

HINT: You could imagine that each square is one metre long.

	To scale in cm
Overall length	
Overall height	
Height of leg to hip	
Height of shoulder	
Height of tail join

Length of	

FOOTPRINTS!

Find the two casts of dinosaur footprints.

One is from a *Brachiosaur*, the other is from an *Iguanodon*.

Measure and compare

- ✓ Draw around your foot on squared paper
- ✓ Cut it out
- ✓ Work out the area by counting the squares

How many squares does one of your feet cover? _____

How could you use this to estimate the number of squares the dinosaur footprint would cover?

Working in a group, use one of the card templates to measure the area.

These are the shapes of the front and back footprints of a *Brachiosaur*.

Which do you think the foot cast in the museum is?

Front

Back

The area of the dinosaur footprint

My estimate: _____ cm²

Can you find a way of calculating the area of the dinosaur footprint

without counting every single square?

My measurement: _____ cm²

Now do the same with the other dinosaur footprint.

Record

The area of the *Brachiosaur* footprint is _____ cm²

The area of the *Iguanodon* footprint is _____ cm²

What is the difference in area? (Remember to include the unit used)

FOOTPRINTS!

MASS

Find out your mass. Use some weighing scales.

My mass = _____ kilograms

We believe an adult *Brachiosaurus* would have weighed about 56 metric tons.

Teaching resources by Education Destination Ltd.

Calculate:

10 x my mass = _____ kg

100 x my mass = _____ kg

1000 x my mass = _____ kg

Write a sentence comparing your mass with the mass of an adult *Brachiosaurus*:

114041

How many times greater than your mass is 56

metric tons?

Extension (at school)

Find out the mass of other objects to compare with the dinosaur.

E.g. How many elephants?

How many buses?
